# (Section 3.1)

Determinants

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

# Outline

• A recursive formula for the determinant

- Special formulas for  $2\times 2$  and  $3\times 3$
- Inverses via determinants

We will give a recursive formula.

First some terminology:

 $A_{ij} = ij$ th minor of  $A = (n-1) \times (n-1)$  matrix obtained by deleting the *i*th row and *j*th column

$$C_{ij} = (-1)^{i+j} \det(A_{ij})$$
  
= ijth cofactor of A

Finally:

$$\det(A) = a_{11}C_{11} + a_{12}C_{12} + \cdots + a_{1n}C_{1n}$$

The recursive formula:

$$\det(A) = a_{11}C_{11} + a_{12}C_{12} + \cdots + a_{1n}C_{1n}$$

Need to start somewhere...

 $1\times 1~\mathrm{matrices}$ 

 $\det(a_{11}) =$ 

 $2\times 2~\mathrm{matrices}$ 

$$\det \left(\begin{array}{cc} a_{11} & a_{12} \\ a_{21} & a_{22} \end{array}\right) =$$

 $3\times 3~\mathrm{matrices}$ 

$$\det \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix} =$$

# Determinants

Compute

$$\det \left( \begin{array}{rrrr} 5 & 1 & 0 \\ -1 & 3 & 2 \\ 4 & 0 & -1 \end{array} \right)$$

Another formula for  $3\times 3$  matrices

$$\det \begin{pmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{pmatrix} = a_{11}a_{22}a_{33} + a_{12}a_{23}a_{31} + a_{13}a_{21}a_{32}$$

 $-a_{13}a_{22}a_{31} - a_{12}a_{21}a_{33} - a_{11}a_{23}a_{32}$ 

Use this formula to compute

$$\det \left( \begin{array}{rrrr} 5 & 1 & 0 \\ -1 & 3 & 2 \\ 4 & 0 & -1 \end{array} \right)$$

#### Expanding across other rows and columns

The formula we gave for det(A) is the expansion across the first row. It turns out you can compute the determinant by expanding across any row or column:

$$det(A) = a_{i1}C_{i1} + \dots + a_{in}C_{in} \text{ for any fixed } i$$
$$det(A) = a_{1j}C_{1j} + \dots + a_{nj}C_{nj} \text{ for any fixed } j$$

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

Compute:

 $\det \left( \begin{array}{rrr} 2 & 1 & 0 \\ 1 & 1 & 0 \\ 5 & 9 & 1 \end{array} \right)$ 

## Determinants of triangular matrices

If A is upper (or lower) triangular, det(A) is easy to compute:

$$\det \left(\begin{array}{rrrr} 2 & 1 & 5 & -2 \\ 0 & 1 & 2 & -3 \\ 0 & 0 & 5 & 9 \\ 0 & 0 & 0 & 10 \end{array}\right)$$

## Determinants

## A formula for the inverse

(from Section 3.3)

 $2\times 2~\mathrm{matrices}$ 

$$A = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \quad \rightsquigarrow \quad A^{-1} = \frac{1}{ad - bc} \begin{pmatrix} d & -b \\ -c & a \end{pmatrix}$$

 $n \times n$  matrices

$$A^{-1} = \frac{1}{\det(A)} \begin{pmatrix} C_{11} & \cdots & C_{n1} \\ \vdots & \ddots & \vdots \\ C_{1n} & \cdots & C_{nn} \end{pmatrix}$$
$$= \frac{1}{\det(A)} (C_{ij})^T$$

Check that these agree!

The proof uses Cramer's rule (see the notes on the course home page).

# A formula for the inverse

(from Section 3.3)

 $n \times n$  matrices

$$A^{-1} = \frac{1}{\det(A)} \begin{pmatrix} C_{11} & \cdots & C_{n1} \\ \vdots & \ddots & \vdots \\ C_{1n} & \cdots & C_{nn} \end{pmatrix}$$
$$= \frac{1}{\det(A)} (C_{ij})^T$$

#### Compute:

$$\left(\begin{array}{rrrr} 1 & 0 & 1 \\ 0 & 1 & 1 \\ 1 & 1 & 0 \end{array}\right)^{-1}$$

# Summary

- Special formulas for  $2\times 2$  and  $3\times 3$  matrices
- Cofactor expansion (works great when there is a row with lots of zeros)

(ロ)、(型)、(E)、(E)、 E) の(の)

• Formula for the inverse
