Section 6.4 The Gram–Schmidt Process

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

## Gram-Schmidt Process

Example

Theorem. Say  $\{u_1, \ldots, u_k\}$  is a basis for a nonzero subspace of  $\mathbb{R}^n$ . Define:

$$v_{1} = u_{1}$$

$$v_{2} = u_{2} - \operatorname{proj}_{\operatorname{Span}\{v_{1}\}}(u_{2})$$

$$v_{3} = u_{3} - \operatorname{proj}_{\operatorname{Span}\{v_{1}, v_{2}\}}(u_{3})$$

$$\vdots$$

$$v_{k} = u_{k} - \operatorname{proj}_{\operatorname{Span}\{v_{1}, \dots, v_{k-1}\}}(u_{k})$$

Then  $\{v_1, \ldots, v_k\}$  is an orthogonal basis for  $\text{Span}\{u_1, \ldots, u_k\}$ .

In other words, if at some stage you find a vector that is not orthogonal to the previous ones, then make it so!

### Gram–Schmidt Process

With three vectors

Find an orthogonal basis for  $W = \text{Span}\{u_1, u_2, u_3\}$ , where

$$u_{1} = \begin{pmatrix} 1 \\ 1 \\ 1 \\ 1 \end{pmatrix}, \quad u_{2} = \begin{pmatrix} -1 \\ 4 \\ 4 \\ -1 \end{pmatrix}, \quad u_{3} = \begin{pmatrix} 4 \\ -2 \\ 2 \\ 0 \end{pmatrix}$$

Section 6.5 Least Squares Problems

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

### Least Squares problems

What if we can't solve Ax = b? How can we solve it as closely as possible?

To solve Ax = b as closely as possible, we orthogonally project b onto Col(A); call the result  $\hat{b}$ . Then solve  $Ax = \hat{b}$ . This is the *least squares solution* to Ax = b.

## Outline

- The method of least squares
- Application to best fit lines/planes

(ロ)、(型)、(E)、(E)、 E) の(()

• Application to best fit curves

 $A = m \times n$  matrix.

A least squares solution to Ax = b is an  $\hat{x}$  in  $\mathbb{R}^n$  so that  $A\hat{x}$  is as close as possible to b.

A least squares solution to Ax = b is an  $\hat{x}$  in  $\mathbb{R}^n$  so that  $A\hat{x}$  is as close as possible to b.

Theorem. The least squares solutions to Ax = b are the solutions to

$$(A^T A)x = (A^T b)$$

Why? By the Best Approximation Theorem,  $A\hat{x} = \operatorname{proj}_{\operatorname{Col}(A)}(b)$ , so  $b - A\hat{x}$  is orthogonal to  $\operatorname{Col}(A)$ , so  $b - A\hat{x}$  is in the null space of  $A^T$ :

$$A^T(b - A\widehat{x}) = 0$$

A useful observation:

If we solve the least squares problem Ax = b and a solution is  $\hat{x}$  then  $A\hat{x}$  is the projection of b onto the column space of A.

So we can use least squares to find projections instead of our previous formula.

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三 のへぐ

Example

Theorem. The least squares solutions to Ax = b are the solutions to

$$(A^T A)x = (A^T b)$$

Find the least squares solutions to Ax = b for the following A and b:

$$A = \begin{pmatrix} 1 & 0 \\ 1 & 1 \\ 1 & 2 \end{pmatrix} \qquad b = \begin{pmatrix} 6 \\ 0 \\ 0 \end{pmatrix}$$

What is the error?

Example

Theorem. The least squares solutions to Ax = b are the solutions to

$$(A^T A)x = (A^T b)$$

Find the least squares solutions to Ax = b for the following A and b:

$$A = \begin{pmatrix} 2 & 0\\ -1 & 1\\ 0 & 2 \end{pmatrix} \qquad b = \begin{pmatrix} 1\\ 0\\ -1 \end{pmatrix}$$

▲□▶ ▲□▶ ▲ □▶ ▲ □▶ □ のへぐ

What is the error?

Theorem. Let A be an  $m\times n$  matrix. The following are equivalent:

1. Ax = b has a unique least squares solution for all b in  $\mathbb{R}^n$

- 2. The columns of A are linearly independent
- 3.  $A^T A$  is invertible

In this case the least squares solution is  $(A^T A)^{-1} (A^T b)$ .

## Application

Best fit lines

Problem. Find the best-fit line through (0,6), (1,0), and (2,0).

▶ Demo

### Best fit lines

Poll

What does the best fit line minimize?

- 1. the sum of the squares of the distances from the data points to the line
- 2. the sum of the squares of the vertical distances from the data points to the line
- 3. the sum of the squares of the horizontal distances from the data points to the line

4. the maximal distance from the data points to the line

# Least Squares Problems

More applications

Determine the least squares problem Ax = b to find the best fit circle/ellipse for the points:

(0,0),(2,0),(3,0),(0,1)

Gauss invented the method of least squares to predict the orbit of the asteroid Ceres as it passed behind the sun in 1801.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

# Least Squares Problems

More applications

Determine the least squares problem Ax = b to find the best parabola (quadratic function of x) for the points:

(0,0),(2,0),(3,0),(0,1)

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

## Least Squares Problems

More applications

Determine the least squares problem  $A \boldsymbol{x} = \boldsymbol{b}$  to find the best fit linear function  $f(\boldsymbol{x},\boldsymbol{y})$ 

x	y	f(x,y)
1	0	0
0	1	1
-1	0	3
0	-1	4

## Summary

- A least squares solution to Ax = b is an  $\hat{x}$  in  $\mathbb{R}^n$  so that  $A\hat{x}$  is as close as possible to b.
- Theorem. The least squares solutions to Ax = b are the solutions to

$$(A^T A)x = (A^T b)$$

▲□▶ ▲□▶ ▲□▶ ▲□▶ ▲□ ● ● ●

• To find a best fit line we plug our data points in for x and y in Ax + By = C. This gives a system of linear equations in A, B, C
