Section 2.4

Solution Sets

Outline

- Understand the geometric relationship between the solutions to $A \boldsymbol{x} = \boldsymbol{b}$ and $A \boldsymbol{x} = \boldsymbol{0}$

- Understand the relationship between solutions to Ax = b and spans
- Learn the parametric vector form for solutions to Ax = b

Homogeneous systems

Solving Ax = b is easiest when b = 0.

Homogeneous systems \leftrightarrow matrix equations Ax = 0.

Homogenous systems are always consistent. Why?

When does Ax = 0 have a nonzero/nontrivial solution?

If there are k-free variables and n total variables, then the solution is a k-dimensional plane through the origin in \mathbb{R}^n . In particular it is a span.

Homogeneous case

Solve the matrix equation Ax = 0 where

$$A = \begin{pmatrix} 1 & 2 & 0 & -1 \\ -2 & -3 & 4 & 5 \\ 2 & 4 & 0 & -2 \end{pmatrix} \rightsquigarrow \begin{pmatrix} 1 & 0 & -8 & -7 \\ 0 & 1 & 4 & 3 \\ 0 & 0 & 0 & 0 \end{pmatrix}$$

We already know the parametric form:

$$x_{1} = 8x_{3} + 7x_{4}$$

$$x_{2} = -4x_{3} - 3x_{4}$$

$$x_{3} = x_{3} \quad \text{(free)}$$

$$x_{4} = x_{4} \quad \text{(free)}$$

We can also write this in parametric vector form:

$$x_3 \begin{pmatrix} 8\\ -4\\ 1\\ 0 \end{pmatrix} + x_4 \begin{pmatrix} 7\\ -3\\ 0\\ 1 \end{pmatrix}$$

Or we can write the solution as a span: $Span\{(8, -4, 1, 0), (7, -3, 0, 1)\}$.

Homogeneous case

Find the parametric vector form of the solution to Ax = 0 where

 $A = \left(\begin{array}{rrrr} 1 & 1 & 1 & 1 \end{array}\right)$

Variables, equations, and dimension

Nonhomogeneous Systems

Suppose Ax = b, and $b \neq 0$.

As before, we can find the parametric vector form for the solution in terms of free variables.

What is the difference?

Nonhomogeneous case

Find the parametric vector form of the solution to Ax = b where:

$$(A|b) = \begin{pmatrix} 1 & 2 & 0 & -1 & | & 3\\ -2 & -3 & 4 & 5 & | & 2\\ 2 & 4 & 0 & -2 & | & 6 \end{pmatrix} \rightsquigarrow \begin{pmatrix} 1 & 0 & -8 & -7 & | & -13\\ 0 & 1 & 4 & 3 & | & 8\\ 0 & 0 & 0 & 0 & | & 0 \end{pmatrix}$$

We already know the parametric form:

$$x_1 = -13 + 8x_3 + 7x_4$$

$$x_2 = 8 - 4x_3 - 3x_4$$

$$x_3 = x_3$$
 (free)

$$x_4 = x_4$$
 (free)

We can also write this in parametric vector form:

$$\begin{pmatrix} -13\\ 8\\ 0\\ 0 \end{pmatrix} + x_3 \begin{pmatrix} 8\\ -4\\ 1\\ 0 \end{pmatrix} + x_4 \begin{pmatrix} 7\\ -3\\ 0\\ 1 \end{pmatrix}$$

Nonhomogeneous case

Find the parametric vector form for the solution to Ax = (9) where

 $A = \left(\begin{array}{rrrr} 1 & 1 & 1 & 1 \end{array}\right)$

 $\left(\begin{array}{rrrr}1 & 1 & 1 & 1 & 1 & 9\end{array}\right)$

Homogeneous vs. Nonhomogeneous Systems

Key realization. Set of solutions to Ax = b obtained by taking one solution and adding all possible solutions to Ax = 0.

Ax = 0 solutions $\rightsquigarrow Ax = b$ solutions

$$x_k v_k + \dots + x_n v_n \rightsquigarrow p + x_k v_k + \dots + x_n v_n$$

So: set of solutions to Ax = b is parallel to the set of solutions to Ax = 0.

So by understanding Ax = 0 we gain understanding of Ax = b for all b. This gives structure to the set of equations Ax = b for all b.

▲□▶▲□▶▲≡▶▲≡▶ ≡ めぬる

Two different things

Suppose A is an $m \times n$ matrix. Notice that if Ax = b is a matrix equation then x is in \mathbb{R}^n and b is in \mathbb{R}^m . There are two different problems to solve.

1. If we are given a specific b, then we can solve Ax = b. This means we find all x in \mathbb{R}^n so that Ax = b. We do this by row reducing, taking free variables for the columns without pivots, and writing the (parametric) vector form for the solution.

2. We can also ask for which b in \mathbb{R}^m does Ax = b have a solution? The answer is: when b is in the span of the columns of A. So the answer is "all b in \mathbb{R}^m " exactly when the span of the columns is \mathbb{R}^m which is exactly when A has m pivots.

If you go back to the \bigcirc from earlier in this section, the first question is happening on the left and the second question on the right.

Summary of Section 2.4

- The solutions to Ax = 0 form a plane through the origin (span)
- The solutions to Ax = b form a plane not through the origin
- The set of solutions to Ax = b is parallel to the one for Ax = 0
- In either case we can write the parametric vector form. The parametric vector form for the solution to Ax = 0 is obtained from the one for Ax = b by deleting the constant vector. And conversely the parametric vector form for Ax = b is obtained from the one for Ax = 0 by adding a constant vector. This vector translates the solution set.
