

Announcements Jan 8

- Mathematical autobiography due on Friday
- WeBWork Warmup due Friday (not for a grade)
- Download the Piazza app
- My office hours **today** 2-3 and Monday 3-4 in Skiles 234
- Studio on Friday: same time, different room, with TA
- Remember the laptop rules

Section 1.1

Solving systems of equations

Outline of Section 1.1

- Learn what it means to solve a system of linear equations
- Describe the solutions as points in \mathbb{R}^n
- Learn what it means for a system of linear equations to be inconsistent

Solving equations

Solving equations

What does it mean to solve an equation?

$$2x = 10 \quad \text{A soln: } x = 5$$

$$x + y = 1 \quad \text{solns: } x=1, y=0$$
$$x=0, y=1$$

$$x + y + z = 0 \quad \text{Solns: } x=y=z=0 \dots$$

Find one solution to each. Can you find all of them?

A solution is a *list* of numbers. For example $(3, -4, 1)$.

Solving equations

What does it mean to solve a system of equations?

$$\begin{aligned}x + y &= 2 \\ y &= 1\end{aligned}$$

a soln: $x = 1$
 $y = 1$

What about...

$$\begin{aligned}x + y + z &= 3 \\ x + y - z &= 1 \\ x - y + z &= 1\end{aligned}$$

yes

no — 3rd eqn.

Is $(1, 1, 1)$ a solution? Is $(2, 0, 1)$ a solution? What are all the solutions?

Soon, you will be able to see just by looking that there is exactly one solution.

\mathbb{R}^n

\mathbb{R}^n

\mathbb{R} = denotes the set of all real numbers

Geometrically, this is the *number line*.

\mathbb{R}^n = all ordered n -tuples (or lists) of real numbers $(x_1, x_2, x_3, \dots, x_n)$

Solutions to systems of equations are exactly points in \mathbb{R}^n .

A point in \mathbb{R}^2 :

$(1, 1)$ or $(\pi, \sqrt{2+e})$

\mathbb{R}^n

When $n = 2$, we can visualize of \mathbb{R}^2 as the *plane*.

\mathbb{R}^n

When $n = 3$, we can visualize \mathbb{R}^3 as the *space* we (appear to) live in.

\mathbb{R}^n

We can think of the space of all *colors* as (a subset of) \mathbb{R}^3 :

\mathbb{R}^n

So what is \mathbb{R}^4 ? or \mathbb{R}^5 ? or \mathbb{R}^n ?

... go back to the *definition*: ordered n -tuples of real numbers

$$(x_1, x_2, x_3, \dots, x_n).$$

They're still “geometric” spaces, in the sense that our intuition for \mathbb{R}^2 and \mathbb{R}^3 sometimes extends to \mathbb{R}^n , but they're harder to visualize.

\mathbb{R}^n

Last time we could have used \mathbb{R}^4 to label the amount of traffic (x, y, z, w) passing through four streets.

We'll make definitions and state theorems that apply to any \mathbb{R}^n , but we'll only draw pictures in \mathbb{R}^2 and \mathbb{R}^3 .

\mathbb{R}^n

and QR codes

This is a 21×21 QR code. We can also think of this as an element of \mathbb{R}^n .

How? Which n ?

What about a greyscale image?

This is a powerful idea: instead of thinking of a QR code as 441 pieces of information, we think of it as one piece of information.

Visualizing solutions: a preview

One Linear Equation

What does the solution set of a linear equation look like?

$x + y = 1$ \rightsquigarrow a line in the plane: $y = 1 - x$

One Linear Equation

What does the solution set of a linear equation look like?

$x + y + z = 1$ \rightsquigarrow a plane in space:

One Linear Equation

Continued

What does the solution set of a linear equation look like?

$x + y + z + w = 1$ \rightsquigarrow a "3-plane" in "4-space"...

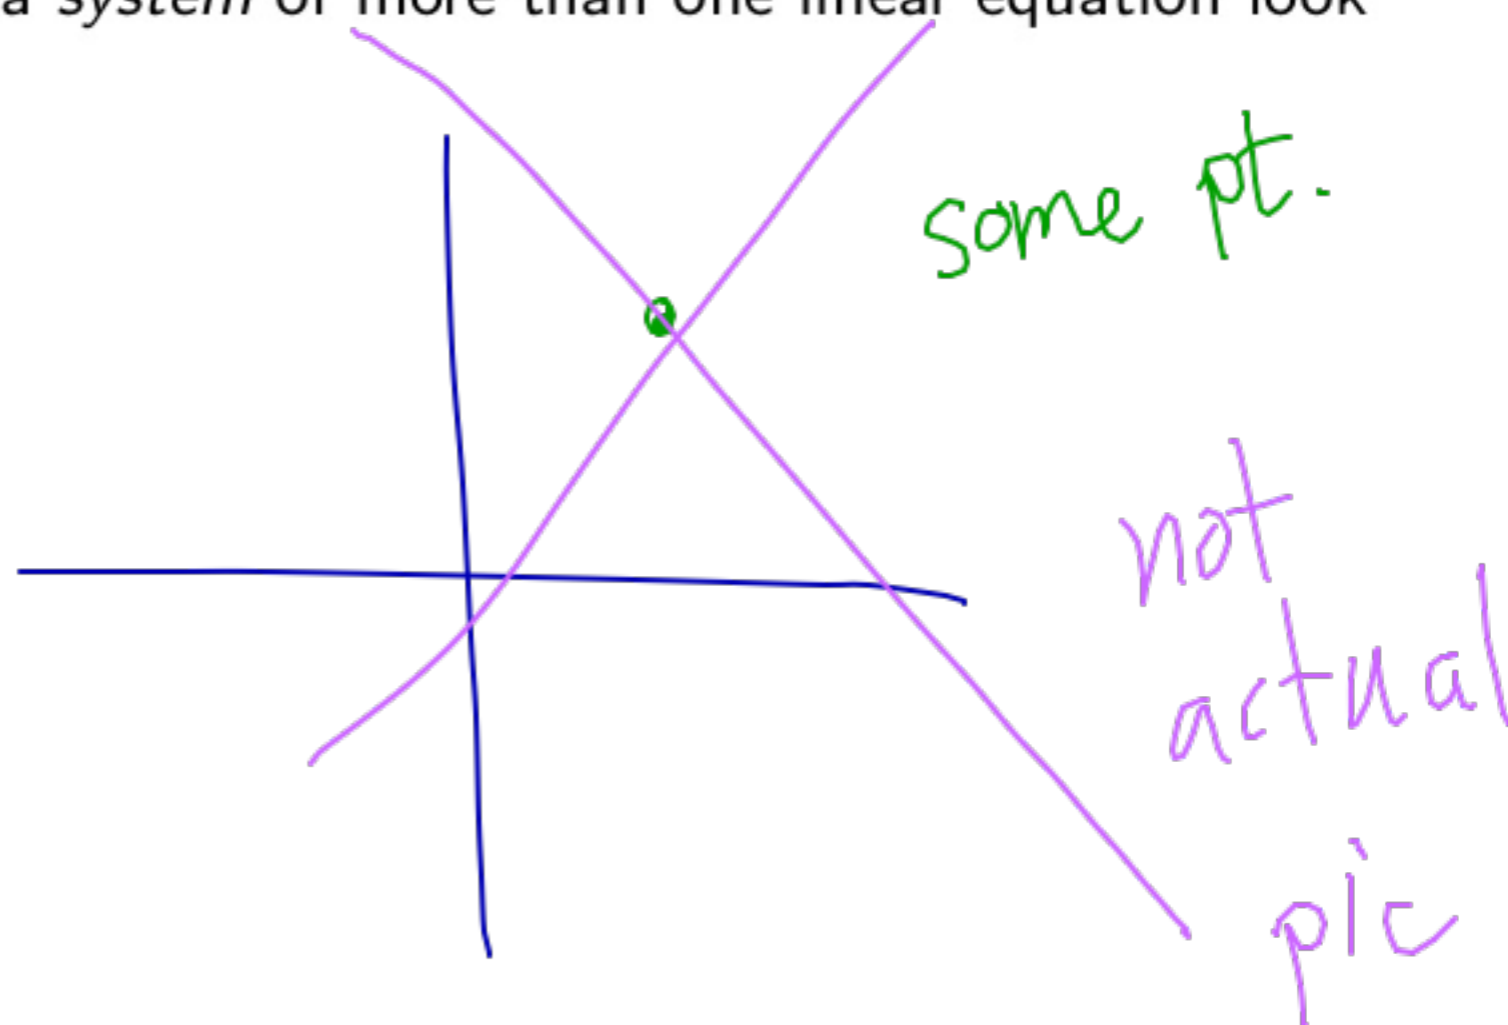

1 eqn in 100 vars:
99 dim plane
in \mathbb{R}^{100}

Systems of Linear Equations

What does the solution set of a *system* of more than one linear equation look like?

$$x - 3y = -3$$

$$2x + y = 8$$

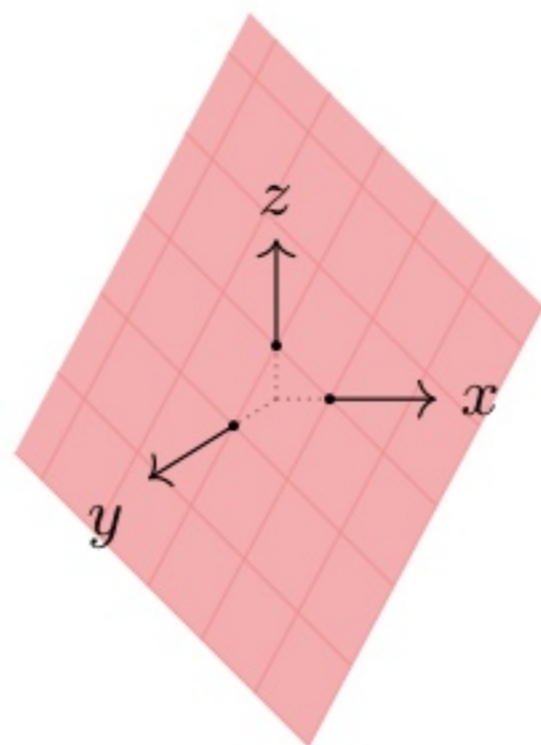

What are the other possibilities for two equations with two variables?

What if there are more variables? More equations?

Poll

Is the plane in \mathbb{R}^3 from the previous example equal to \mathbb{R}^2 ? What about the xy -plane in \mathbb{R}^3 ?

1. yes + yes
2. yes + no
3. no + yes
4. no + no

Consistent versus Inconsistent

We say that a system of linear equations is consistent if it has a solution and inconsistent otherwise.

Why is this inconsistent?

$$x + y = 1$$

$$x + y = 2$$

What are other examples of inconsistent systems of linear equations?

Parametric form

The equation $y = 1 - x$ is an **implicit equation** for the line in the picture.

It also has a **parametric form**: $(t, 1 - t)$

Similarly the equation $x + y + z = 1$ is an implicit equation. One parametric form is: $(t, w, 1 - t - w)$.

Parametric form

The equation $y = 1 - x$ is an **implicit equation** for the line in the picture.

It also has a **parametric form**: $(t, 1 - t)$

Similarly the equation $x + y + z = 1$ is an implicit equation. One parametric form is: $(t, w, 1 - t - w)$.

Imp: $z = 0$
Param: $(t, w, 0)$

What is an implicit equation and a parametric form for the xy -plane in \mathbb{R}^3 ?

Summary of Section 1.1

- A solution to a system of linear equations in n variables is a point in \mathbb{R}^n .
- The set of all solutions to a single equation in n variables is an $(n - 1)$ -dimensional plane in \mathbb{R}^n .
- The set of solutions to a system of m linear equations in n variables is the intersection of m of these $(n - 1)$ -dimensional planes in \mathbb{R}^n .
- A system of equations with no solutions is said to be inconsistent.
- Line and planes have implicit equations and parametric forms.
